

VERIFYX AI

AI-Based Fake Identity & Document Screening System

TEAM: CODE SHELL

TEAM MEMBERS: SPOORTHY GR
ANUSHA SH

“Verify the Document. Verify the Identity.”

The Problem

- Fake or modified documents are difficult to identify manually.
- Manual verification takes time and effort.
- A genuine document can also be presented by another person.
- Different documents require different verification methods.

Traditional verification depends heavily on manual checking. VerifyX AI provides a digital screening process to analyze documents and available verification information.

Our Solution

VerifyX AI provides a single platform to screen identity documents digitally. It analyzes the uploaded document, extracts information, performs available verification checks and generates a structured risk assessment.

- Upload identity document
- Identify document type
- Extract information using OCR
- Analyze the document
- Perform available verification checks
- Generate risk assessment
- Store verification history

System Workflow

Steps 1–4 (top row) lead into steps 5–7 (bottom row).

Main Features

Document Detection

Identifies the type of uploaded identity document.

OCR

Extracts important information from the document.

Document Integrity

Analyzes document characteristics for suspicious changes.

QR Verification

Performs QR-related checking when available.

Liveness Verification

Checks the captured live image when applicable.

Face Verification

Checks the available document photo against the live photo.

Risk Assessment

Combines available verification signals into a structured result.

Verification History

Stores previous screening records and allows filtering by date.

Technology Stack

Frontend

- HTML
- CSS
- JavaScript

Backend

- Python
- Django

AI & Document Processing

- Machine Learning
- OCR
- OpenCV
- PDF Processing

Database

- SQLite / PostgreSQL

The frontend handles user interaction, Django manages the backend, AI and document-processing components analyze the uploaded document, and the database stores verification records.

Result & Future Scope

Future Scope

- Support more identity documents
- Support documents from different countries
- Improve OCR and document analysis
- Improve AI-based tamper detection
- Support more digital documents and PDFs
- Add more document-specific verification methods
- Improve secure verification history

Verify the Document. Verify the Identity.
